Shells ○●○○○○ Usage Bash shell: practical uses for your systems skills

Activity 0000

▲ロト ▲圖 ト ▲ 臣 ト ▲ 臣 ト ○ 臣 - のへで

bash is used in many ways

Command processor, or programming language?

Both!

Shells ○○●○○○ Usage Bash shell: practical uses for your systems skills

Activity 0000

Interactive vs. scripting

- Interactive case: human types commands at a prompt
- You've been using bash this way.
- Your tsh will work this way.

Shells ○○●○○○ Usage Bash shell: practical uses for your systems skills

Activity 0000

Interactive vs. scripting

- Shell script: any commands you could type at the shell prompt could also go into a file
- bash then interprets that file as a sequence of commands
- thie file is typically called a script (denoted by .sh filename extension)

Interactive vs. scripting

bash as Command Processor

- Interactive case: human types commands at a prompt
- You've been using bash this way.
- Your tsh works this way.

bash as Programming language

- Shell script: any commands you could type at the shell prompt could also go into a file
- bash then interprets that file as a sequence of commands
- thie file is typically called a script (denoted by .sh filename extension)

Scripts vs. Programs

▲ロト ▲帰 ト ▲ ヨ ト ▲ ヨ ト ・ ヨ ・ の Q ()

Script? Program? What's the difference?

- scripts are text files which are interpreted
- Scripting languages: bash, perl, python (many more)
- An interpreter reads script text every time it runs and then performs commands

Scripts vs. Programs

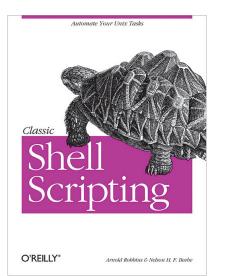

Script? Program? What's the difference?

- scripts are text files which are *interpreted*
- Scripting languages: bash, perl, python (many more)
- An interpreter reads script text every time it runs and then performs commands
- Traditional programming languages are compiled
- A compiler converts human-readable source code to machine-level instructions (may be called binary or executable)
- These machine-level instructions are the focus of Chapter 3

Scripts vs. Programs

(日)、(型)、(E)、(E)、(E)、(O)(()

Computing your score so far

What did we just do? more on wildcards

- Could also match a single character:
 - cat SCORE.lab?
- Would match SCORE.lab9 but *not* SCORE.lab10
- Or, match only certain characters:

Bash shell: practical uses for your systems skills 00000000000

Activity 0000

(日)、(型)、(E)、(E)、(E)、(O)(()

Computing your score so far

What did we just do?

- Could also match a single character:
 - cat SCORE.lab?
- Would match SCORE.lab9 but not SCORE.lab10
- Or, match only certain characters: cat SCORE.lab[01]

Bash shell: practical uses for your systems skills 00000000000

Activity 0000

(日)、(型)、(E)、(E)、(E)、(O)(()

Computing your score so far

What did we just do? more on wildcards

- Could also match a single character:
 - cat SCORE.lab?
- Would match SCORE.lab9 but *not* SCORE.lab10
- Or, match only certain characters: cat SCORE.lab[01]
- matches only SCORE.lab0 and SCORE.lab1

Bash shell: practical uses for your systems skills 00000000000

Activity 0000

Computing your score so far

What did we just do? more on wildcards

- Could also match a single character:
 - cat SCORE.lab?
- Would match SCORE.lab9 but not SCORE.lab10
- Or, match only certain characters: cat SCORE.lab[01]
- matches only SCORE.lab0 and SCORE.lab1 (not SCORE.lab2) or any others

Activity 0000

▲ロト ▲帰 ト ▲ ヨ ト ▲ ヨ ト ・ ヨ ・ の Q ()

Computing your score so far

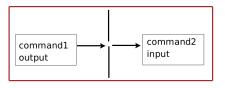

What did we just do? more on wildcards

- Try creating a SCORE.lab10 file with: echo 100 > SCORE.lab10
- remember output redirection?
- Then compare:
 - cat SCORE.lab?
 - cat SCORE.lab??
 - cat SCORE.lab*
- Delete SCORE.lab10 when finished: rm SCORE.lab10
- Be very careful using * with rm !

Activity 0000

Computing your score so far

What did we just do? Pipes

- I is called a "pipe"
- cmd1 output normally goes to the screen

... but instead becomes cmd2 input (another type of redirection)

- Then cmd2 output goes to screen

... but *could* be written to a file:

cmd1 | cmd2 > outputfile

• Many more examples on Bash redirections cheat sheet

Activity 0000

Computing your score so far

What did we just do? Shell script example

```
#!/bin/bash
TOTAL=0
while read val; do
        TOTAL=$(($TOTAL+$val))
done
echo $TOTAL
```

- sum.sh is a *shell script* (text file)
- commands interpreted by program /bin/bash
- would also work if typed in at the prompt:

```
TOTAL=0;
```

```
while read val; do TOTAL=$(($TOTAL+$val)); done;
echo $TOTAL
```

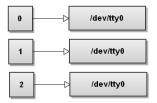

Bash shell: practical uses for your systems skills ${\tt 0000000000000}$

Activity 0000

(日)、(型)、(E)、(E)、(E)、(O)(()

Computing your score so far

What did we just do?

- sum.sh run by itself takes input from keyboard (each number on its own line, end with CTRL-D)
- file descriptors 0, 1 and 2 commonly referred to as: stdin, stdout, stderr

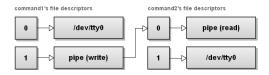

Images from http://www.catonmat.net/blog/bash-one-liners-explained-part-three/

Bash shell: practical uses for your systems skills ${\tt 00000000000000}$

Activity 0000

Computing your score so far

What did we just do?

• Thanks to the pipe we used, instead the input to the sum program came from those SCORE.* files

(actually sum.sh didn't read files, it read the output of cat)

- keeps sum.sh program very simple
- Also works with C programs (file descriptors 0 and 1, open() and dup2())

Images from http://www.catonmat.net/blog/bash-one-liners-explained-part-three/

More common tools

grep: print lines matching a pattern

Make yourself a copy of this example file:

```
\label{eq:cp_loss} cp \ /home/CSCI2467/labs/bash/lab0-comments \ .
```

Then run:

grep part lab0-comments

- strange name, used as noun or verb
- simple and very useful
- example above: find any line containing "part" in file lab0-comments (contains several lines)
- case sensitive! try with Part instead
- (try with option -i for insensitive)
- could write result to a file with:

```
grep Part lab0-comments > mylab0parts
```

Bash shell: practical uses for your systems skills 000000000000

More common tools

Pipes make grep even more useful

Bash shell: practical uses for your systems skills

Activity •000

▲ロト ▲帰 ト ▲ ヨ ト ▲ ヨ ト ・ ヨ ・ の Q ()

Make a shell script

Extra credit opportunity

- Go to AutoLab
- look for extra credit bash scripting
- the *writeup* is these slides (at the end of the PDF files)
- the *handout* is called grep.tar

Bash shell: practical uses for your systems skills 00000000000 Activity •000

▲ロト ▲帰 ト ▲ ヨ ト ▲ ヨ ト ・ ヨ ・ の Q ()

Make a shell script

Extra credit opportunity

- Go to AutoLab
- look for extra credit bash scripting
- the *writeup* is these slides
 - (at the end of the PDF files)
- the *handout* is called grep.tar also can be found at:

/home/CSCI2467/labs/misc/grep.tar

Make a shell script

Extra credit opportunity

- Add up to 5 points to your point total
- Create a shell script called secretfinder.sh which:
- create a directory called secretfiles and change into it
- extract files from grep.tar
- use grep command to find which file contains the SECRET AUTH CODE
- write the name of that file to a new file called: authcode.txt
- remove the 1000 files tar created (but leave authcode.txt)¹
- print "Found the secret auth code! Saved to authcode.txt" to the screen (not to the authcode.txt file)
- Hand in your solution (only secretfinder.sh) using AutoLab

¹Again be careful with rm and see tips on next page $\rightarrow \langle B \rangle \rightarrow \langle B \rangle \rightarrow \langle B \rangle \rightarrow \langle B \rangle$

- Begin your file (the very 1st line) with #!/bin/bash
- after that you can comment each line using the # symbol
- put your name and the date in a comment at the top
- comment subsequent commands
- To extract files use:

tar xf grep.tar

• To delete the 1000 files, use rm f*== notice how the above command should only delete files that start with "f" and end with "==" Make a shell script
